

Appl. No. 10/711,313
Amtd. dated May 8, 2006
Reply to Office action of February 21, 2006

Amendments to the Claims:

1. (currently amended) A delay lock loop circuit for delaying a reference clock to lock a delayed clock, the delay lock loop circuit comprising:

5 a clock divider for dividing a frequency of the reference clock by N to generate a frequency-divided clock;

10 a programmable delay circuit electrically coupled to the clock divider, the programmable delay circuit for delaying the frequency-divided clock to generate the delayed clock;

15 a 180° phase detector electrically coupled to the programmable delay circuit, the 180° phase detector for detecting a phase change of the delayed clock; and

20 a multiplexer electrically coupled to the clock divider and the reference clock for sending either the reference clock or the frequency-divided clock as the driving clock to the 180° phase detector; and

25 a delay lock loop controller electrically coupled to the programmable delay circuit and the 180° phase detector, the delay lock loop controller for programming the programmable delay circuit to lock the delayed clock according to the phase change.

2. (canceled)

3. (currently amended) The delay lock loop circuit of claim 21 wherein if the driving clock is the reference clock, the 180° phase detector is triggered once every N cycles of the reference clock, and if the driving clock is the frequency-divided clock, the 180° phase detector is triggered once each cycle of the frequency-divided clock.
5
4. (original) The delay lock loop circuit of claim 1 wherein a driving clock of the 180° phase detector is the frequency-divided clock.
- 10 5. (original) The delay lock loop circuit of claim 4 wherein the 180° phase detector is triggered once each cycle of the frequency-divided clock.
6. (original) The delay lock loop circuit of claim 1 wherein a driving clock of the 180° phase detector is the reference clock.
15
7. (original) The delay lock loop circuit of claim 6 wherein the 180° phase detector is triggered once every N cycles of the reference clock.
- 20 8. (withdrawn) A delay lock loop circuit for delaying a reference clock to lock a frequency-divided clock, the delay lock loop circuit comprising:
 - a programmable delay circuit for delaying the reference clock to generate a delayed clock;
 - 25 a clock divider electrically coupled to the programmable delay circuit, the clock divider for dividing a frequency of the delayed clock by N to generate a frequency-divided clock;

Appl. No. 10/711,313
Amdt. dated May 8, 2006
Reply to Office action of February 21, 2006

a 180° phase detector electrically coupled to the clock divider, the 180° phase detector for detecting a phase change of the frequency-divided clock; and

5 a delay lock loop controller electrically coupled to the programmable delay circuit and the 180° phase detector, the delay lock loop controller for programming the programmable delay circuit to lock the frequency-divided clock according to the phase change.

10 9. (withdrawn) The delay lock loop circuit of claim 8 wherein a driving clock of the 180° phase detector is the reference clock.

10. (withdrawn) The delay lock loop circuit of claim 9 wherein the 180° phase detector is triggered once every N cycles of the reference clock.

15 11. (currently amended) A method for delaying a reference clock to lock a delayed clock, the method comprising:

dividing a frequency of a reference clock by N to generate a frequency-divided clock;

20 delaying the frequency-divided clock by an amount of delay to generate the delayed clock;

25 providing a 180° phase detector, and utilizing the 180° phase detector for detecting a phase change of the delayed clock; and

Appl. No. 10/711,313
Amdt. dated May 8, 2006
Reply to Office action of February 21, 2006

selecting the reference clock or the frequency-divided clock to be a driving clock of the 180° phase detector.

programming the amount of delay for locking the delayed clock according to the
5 phase change.

12. (canceled)

13. (currently amended) The method of claim 1211 wherein if the driving clock is
10 the reference clock, the 180° phase detector is triggered once every N cycles of the reference clock, and if the driving clock is the frequency-divided clock, the 180° phase detector is triggered once each cycle of the frequency-divided clock.

14. (original) The method of claim 11 wherein a driving clock of the 180° phase
15 detector is the frequency-divided clock.

15. (original) The method of claim 14 wherein the 180° phase detector is triggered once each cycle of the frequency-divided clock.

20 16. (original) The method of claim 11 wherein a driving clock of the 180° phase detector is the reference clock.

17. (original) The method of claim 16 wherein the 180° phase detector is triggered once every N cycles of the reference clock.

25 18. (withdrawn) A method for delaying a reference clock to lock a frequency-divided clock, the method comprising:

Appl. No. 10/711,313
Amtd. dated May 8, 2006
Reply to Office action of February 21, 2006

delaying a reference clock by an amount of delay to generate a delayed clock;

dividing a frequency of the delayed clock by N to generate the frequency-divided clock;

providing a 180° phase detector, and utilizing the 180° phase detector for detecting a phase change of the frequency-divided clock; and

10 programming the amount of delay for locking the frequency-divided clock according to the phase change.

15 19. (withdrawn) The method of claim 18 wherein a driving clock of the 180° phase detector is the reference clock.

20. (withdrawn) The method of claim 19 wherein the 180° phase detector is triggered once every N cycles of the reference clock.

21. (previously presented) A delay lock loop circuit comprising:

20 a clock divider and programmable delay circuit for dividing a frequency of a reference clock by N and delaying the frequency to thereby generate a delayed and frequency-divided clock;

25 a 180° phase detector electrically coupled to the clock divider and programmable delay circuit, the 180° phase detector for detecting a phase change of the delayed and frequency-divided clock; and

Appl. No. 10/711,313
Amdt. dated May 8, 2006
Reply to Office action of February 21, 2006

5 a delay lock loop controller electrically coupled to the clock divider and programmable delay circuit, and the 180° phase detector; the delay lock loop controller for programming the clock divider and programmable delay circuit to lock the delayed and frequency-divided clock according to the phase change.

22. (currently amended) A method for delaying a reference clock, the method comprising:

10 dividing a frequency of a reference clock by N and delaying the frequency reference clock by an amount of delay to thereby generate a delayed and frequency-divided clock;

15 providing a 180° phase detector, and utilizing the 180° phase detector for detecting a phase change of the delayed and frequency-divided clock; and

15 programming division of the reference clock and amount of delay for locking the delayed and frequency-divided clock according to the phase change.

23. (new) A delay lock loop circuit for delaying a reference clock to lock a delayed 20 clock, the delay lock loop circuit comprising:

a clock divider for dividing a frequency of the reference clock by N to generate a frequency-divided clock;

25 a programmable delay circuit electrically coupled to the clock divider, the programmable delay circuit for delaying the frequency-divided clock to generate the delayed clock;

Appl. No. 10/711,313
Amtd. dated May 8, 2006
Reply to Office action of February 21, 2006

a 180° phase detector electrically coupled to the programmable delay circuit, the 180° phase detector for detecting a phase change of the delayed clock using the reference clock as a driving clock; and

5

a delay lock loop controller electrically coupled to the programmable delay circuit and the 180° phase detector, the delay lock loop controller for programming the programmable delay circuit to lock the delayed clock according to the phase change.

10 24. (new) A method for delaying a reference clock to lock a delayed clock, the method comprising:

dividing a frequency of a reference clock by N to generate a frequency-divided clock;

15

delaying the frequency-divided clock by an amount of delay to generate the delayed clock;

20

providing a 180° phase detector, and utilizing the 180° phase detector for detecting a phase change of the delayed clock;

25

utilizing the reference clock as a driving clock of the 180° phase detector; and

programming the amount of delay for locking the delayed clock according to the phase change.
